

IMsafe

- Monitor IM usage by users
- Log all IM messages
- Block IM SPAM
- Spot keywords in IM messages
- Control File transfer via IM
- True End-to-end encryption
- Restrict IM to specific users
- Stealth mode monitoring
- Small footprint and very low system resource usage

The Business Challenge

IMsafe™ is an easy to use solution to control, monitor, and secure IM communications.

Use of IMs in corporate networks is rising. Nearly 25% of all IM usage is done from a corporate network and over 50% of all companies use IM. While there are close to 400 million people using IMs from corporate network, only 10% of the corporations have a policy or mechanism to control IM usage.

IMs are a wonderful tool and are proving superior to e-mail as a collaborative and communication medium. It is expected that IM usage will eventually overtake e-mail usage.

However, IMs also create a new attack vector. IM access provides hackers with a direct channel into the enterprise network. This new attack vector is gaining popularity for installing rootkits, spyware, and Trojans. Without proper safeguards, IM usage can

pose security challenges and it can also be abused by users for personal use.

IMsafe is a complete solution to control, monitor, and secure IM use in enterprise. It is able to overcome the security and monitoring issues related to IM usage and helps IM become a useful tool for the enterprise. IMsafe works with all popular public IM services (Yahoo!, MSN, AOL, and ICQ).

Powerful Enterprise Class Solution

IMsafe is a scalable solution to reign in IM usage in even the largest networks with several thousand users. Central management with local enforcement of IM security policies means there is no bottleneck in process. Local enforcement of policies ensures mobile and road warrior nodes security as well.

With no gateway to install, IMsafe will never be a point of failure nor a reason for network traffic disruption in your network. Unlike hardware and other point solutions, IMsafe is truly scalable. With IMsafe there will never be a need for a major hardware upgrade as the usage of IM increases.

Affordable and Easy to Use

Annual subscription rates as low as \$5 per user per year, make IMsafe the most cost effective solution in the market. IMsafe's mission goes beyond "monitoring and filtering." IMsafe is a complete solution that can be used for all public IM networks. IMsafe achieves a very attractive price point, but provides far more features than any other competing product.

IMsafe is very easy to use and because it integrates with the popular IM clients to provide security, the end user never has to make a switch to a proprietary IM client.

IMsafe can be centrally deployed, managed, and monitored, and works without requiring any input from the end users. With a simple and easy to use GUI, making any changes to corporate IM policy is just a click away.

The central management of IMsafe clients can be completely automated to silently deliver daily definitions and software updates. Any changes in the policies are automatically pushed to the clients.

IMsafe Client Side Features

IMsafe client seamlessly integrates with the IM clients (Yahoo!, MSN, AOL etc.) installed on the computers to monitor and control all IM communications.

IMsafe makes it possible to restrict IM usage by:

- Type of IM clients (Yahoo!, AOL, MSN, etc.)
- Identities used in IM exchange
- Time during which IM can be used

Restricting the identities in IM communication is a very effective method to prevent personal use of IM from corporate networks.

IMsafe prevents information theft by controlling and blocking:

- File transfers via IM
- Keywords and expression in IM messages

To prevent an outsider from eavesdropping on corporate IM communication, IMsafe will end-to-end encrypt all IM communications. IMsafe logs all encrypted IM communication after decrypting them.

IMsafe blocks IM spam from unauthorized users and also prevents attacks via IM.

IMsafe monitors all IM activity and displays it in easy to read charts. Daily charts show hour-by-hour IM activity by the users.

IMsafe Management Features

Trlokum central management (TCM) makes it easy to deploy, configure, and monitor IMsafe clients from a central location.

TCM is highly scalable and can manage a large number of SpyWall clients. TCM's "on-demand" and push based management system ensures that policies are updated at all PCs in the network with minimum delay.

From the TCM console, the administrator can:

- Remotely install and manage client software
- Manage policies based on Profile
- Monitor IM usage on a per user basis

- Even remotely run installer packages for third-party software
- Detect unauthorized software installation
- Rapid response to IM threats

To improve security and compliance with corporate security policies, TCM will detect any PCs that do not have IMsafe installed. It can even detect disabling of IMsafe client on PCs.
